Abstract (en)  
[origin: WO0117211A2] The invention relates to a method and an arrangement for connecting and disconnecting communications links via a private branch exchange. The transport network for transporting the communications data is preferably designed as an ATM network or IP network and is controlled by a control network separated therefrom. The advantage is that both networks are independent from one another and that the number of modules can easily be increased with regard to broad band communications requests. Already present central data on users can be used and control units of performance characteristics that are also related to the connection can be further used by virtue of the central design of the control unit.
