Abstract (en)  
The racket or paddle provided for playing tennis and other similar ball games, presents a first improvement consisting in that the handle is determined by two sections (2) and (3) coupled axially between themselves and having means which allow the movement of section (3) respecting section (2) and thus the extension of the handle itself, as well as the locking of sections (2) and (3) both in the position in which they determine a handle of regular length as well as in its extended position. Another improvement consists in that on one or more sections of the frame or edge of the racket there is mounted, with an independent nature, a means constituted from a base (17) attachable to the edge of the racket, and on its base at the same time there is an adhesive strip (21), by means of which and without the user having to bend over he can collect a ball from the ground putting it within the reach of his hand. <IMAGE> <IMAGE>
