Abstract (en)
[origin: EP1209084A1] The movable element (5) is moved forward through an intermediate lever (4), which can be rotated through a lever (3). The lever (3) projects to the front out of a handle (2) with the help of a spring force and is drawn back into the handle in order to drive a connecting rod of the label rod through the piston (5a) into a hollow needle (12). A supply element (6) has a projecting tooth which engages with a connecting section of the label rod. The supply element (6) is located in parallel to a blocking element (15).
