Abstract (en)

[origin: WO0114284A1] A method of making a composite product includes the steps of mixing a hydraulic binder and water to form a paste and then introducing a foam into the paste to form a foamed product. The foam is generated from a mixture of a polyvinyl alcohol solution and a second hydrophilic polymer such as gelatin. The foamed product is formed into a desired shape and the hydraulic binder is allowed to set to form the composite product.
