Abstract (en)

[origin: WO0079284A1] Immunoassays for measuring type II collagen (cartilage) resorption <i>in vivo</i> employ either one or two antibodies. A first antibody binds to DEKAGGA (SEQ ID NO:21) but not to GGFDEKAGGAQLG (SEQ ID NO:27), where the K symbols refer to lysine or preferably to cross-linking 3-hydroxypyridinium residues. Measurement of analyte binding to the first antibody in serum provides an indication of unmineralized cartilage resorption <i>in vivo</i>. A second antibody binds to GGFDEKAGGAQLG but not to DEKAGGA. Measurement of analyte binding to the second antibody in serum provides an indication of mineralized cartilage resorption <i>in vivo</i>. An indication of total (unmineralized and mineralized) cartilage resorption <i>in vivo</i> is provided by either measurement of analyte binding to the first antibody in urine, or by measurement of the total analyte binding to the first and second antibodies in serum.
