Abstract (en)

[origin: WO0217017A1] The invention relates to a projection arrangement for projecting an image onto a projection surface comprising a light source (26), a control unit (25), a light modulator (10) which can be controlled by the control unit (25) in order to generate an image based on predetermined image data, followed by an optical device (11) for projecting an image onto the projection surface (34), a film gate (2) for holding a positive image recorded onto a support medium, a projection optic (3) arranged to the rear of the film gate (2) when projecting the positive image, and a control device (6) which allows either the light modulator (10) to be impinged upon with the light from the light source (26) or which enables a positive image held by the film gate (2) to be illuminated with light. A projection arrangement is provided which can project positive images as well as images generated from predetermined data onto a projection surface (34).
