Abstract (en)

[origin: WO0120557A1] In an entrance zone (21), or a prompting zone (21'), a second transmitting-receiving module (12) located on the ticket (10) is activated (INF1). A communication (INF2, INF3) can thus be established between the ticket (10) and a second transmitting-receiving unit (32) which is assigned to a detection zone (22). During this communication, the presence of the ticket (10) is determined and registered in a defined time-slot pattern. This guarantees a reliable and fraud-proof detection of tickets. The method and system for registering tickets (10) is used in public transport, at exhibitions and in secured areas.
