Abstract (en)

[origin: FR2798112A1] The invention concerns a device (1) for stabilising a two-wheeled vehicle such as a scooter, comprising retractable stands (2A, 2B) arranged on either side of said vehicle, members (5, 6) for controlling said stands between a first state wherein they are retracted, and a second state wherein they are in stabilising contact with the ground. The control members comprise a lever mechanism connected to the stands and accessible on the vehicle footrest such that said lever mechanism can be actuated by the rider's feet in riding position. A pressure exerted frontwards by at least one foot of the rider on said lever mechanism produces the first retracted state whereas a pressure exerted rearwards on said lever mechanism produces the second stabilising state.
