Abstract (en)

[origin: WO0121841A1] The invention concerns a method using a probe whereof the part inside the chamber of said kiln is not provided with sensors. The method consists in associating to the part of the probe outside the kiln chamber a sensor sensitive to the impact of materials charged over part of the probe introduced in the kiln chamber and in observing a signal generated by said sensor in connection with the part of the probe outside the chamber; moving the probe head inside the kiln chamber and in recording the observed signal as the probe moves; plotting curves whereon can be read the width of the flux of materials, the centre of gravity of said flux and the density of materials poured along a direction coinciding with the trajectory of the moving probe head.
