Abstract (en)

[origin: WO0122677A2] The invention relates to a novel private extension unit arrangement and the migration solutions of existing devices. Communications links are produced by means of a transport network. Control is carried out in a centralised manner by means of a central control device which is connected to the decentralised network devices and the interface modules via a two-step connection. The control messages are collected and distributed in a decentralised manner. The control connection from a decentralised device respectively to the central control device is provided via an ATM network or an ethernet connection.
