Abstract (en)
[origin: WO0117313A1] A system, method and article of manufacture are provided for providing a high speed network. One component is a customer network which is accessed by a plurality of customers. An edge network interfaces with the customer network. The edge network provides services to the customers. A core network interfaces with the edge network. The core network performs a plurality of tasks including consolidating low-speed traffic streams from the edge network into high-speed trunks, simplifying topologies of the networks, and realizing bandwidth efficiencies across the high speed network.
