Abstract (en)
[origin: WO0124462A1] Customized audio for VoIP sessions, or other packet-switched networks for carrying voice, is processed according to a hearing profile of the participants. A processor (13, 14, 17) coupled to a packet-switched communication network (12) processes a flow of packets carrying voice data according to the hearing profiles of the intended recipients. The flow of packets in various embodiments is compliant with a standard Internet Protocol, including, for example, ITU-T Recommendation H.323. The hearing profile data is stored in one embodiment with a registry of users (15, 18, 19). Resources are included in this embodiment to associate data from the registry characterizing a hearing profile of the user with a flow of packets in the packet-switched network for use in customizing the voice data.
