Abstract (en)

[origin: DE19946960A1] The invention relates to a method in which a call directed to the subscriber link (10) of a fixed network subscriber is diverted to a server (22). A current network address of a further subscriber link where the subscriber is available is transmitted to the server (22) and the server (22) then diverts the incoming call to the first subscriber link, according to the corresponding stored settings, to the further subscriber link available under the given network address or to a voice mail system or a recorded announcement on the telecommunication network.
