Abstract (en)

[origin: WO0117212A2] According to the inventive method for diverting telecommunications connections, a predetermined number of line identifications (A 1<1> - A1<N>) are first made available. When participation in the diversion process is requested, a free line identification is allocated (A1<1> - A1<N>). Subsequently, all of the telecommunications connections directed at this line identification (A1<1>) are diverted to a telecommunications terminal (A2).
