Abstract (en)

[origin: EP1216843A2] The wall calendar has a stack of sheets, which are held along one side by at least one binding component (B). The sheets can be turned over individually. The binding component is made of wire (10) formed meander-fashion into engagement components (12) set apart in a predetermined pattern (a). These components grip into stamped holes in the stacked sheets. A fixture component can be brought into engagement with several engagement components, around which it grips. It can be further released from the engagement components.
