Abstract (en)

[origin: WO0105281A1] The mechanism which makes the bottommost spoon (1, 1B) in each stack protrude from a corresponding opening (24) in the front of the box comprises a pivoting right-angled operating lever (20) and a slide (22) connected by a flexible strip (38), the slide (22) being pulled in the opposite direction to the direction (f2) of extraction by an elastic band (44) hooked onto pegs (22C and 42); the slide (22) has a projection (22A) which entrains the spoon to be extracted.
