Abstract (en)  
[origin: WO0125567A1] The invention relates to scaffolding (2) for supporting heavy loads, comprising several substantially 2-dimensional frame elements (8, 10, 58, 60, 62). When the scaffolding is erect (2), each of the said frame elements is connected to at least one additional frame element (8, 10, 58, 60, 62) at junction points (76, 78, 80, 82). The scaffolding is characterised in that the junction points (76, 78, 80, 82) of a frame element (8, 10, 58, 60, 62) lie substantially at the vertices of a triangle.
