Abstract (en)
[origin: WO0125583A1] The invention relates to a device for roller shutters for cupboards. A plurality of roller shutter profiles (2) are articulated to one another and are guided in lateral profile guiding rails (4). A roller shutter drive device (1) is inserted into the device as a counterweight and prevents an unwanted opening and closing of said roller shutter for cupboards. The roller shutter for cupboards can be fixed by means of axles (111, 101) which protrude at the free ends of said roller shutter. The aim of the invention is to prevent the disadvantages and difficulties of devices of prior art using the inventive device. The aim of the invention is also to variably use the inventive device in cupboards of different widths without affecting the function thereof. The aim of the invention is further to easily assemble and produce the inventive device in a cost-effective manner. To this end, at least one free end (1111, 1012) of the protruding axle (111, 101) is moveably mounted in the axial direction.
