Abstract (en)

[origin: WO0127955A1] The invention relates to an actuator unit that is provided with a base actuator (1) and an additional actuator (2). A useful circuit (4) can be opened and closed by means of said actuators. The base actuator (1) can be activated by supplying electric energy during normal functioning and can be deactivated by not supplying electric energy. The additional actuator (2) can be deactivated by supplying electric energy and can be activated manually. A control unit (3) deactivates the additional actuator (2) only when a real activation state of the base actuator (1) deviates from a desired activation state of the base actuator (1).
