Abstract (en)
[origin: WO0126307A1] System and method for providing a messaging service, such as a voice mail service over a digital subscriber loop are presented. An incoming call is first routed to a service processor. The incoming call is to be delivered over the digital subscriber loop to a receiving device. A determination is made as to whether or not the incoming call is answered by the receiving device. The incoming call is routed to a message processor if the incoming call is not answered by the receiving device. The incoming call is stored at the message processor for later retrieval.
