Abstract (en)
[origin: WO0127525A1] A lamp comprises a transparent fuel reservoir for receiving a burnable liquid, which fuel reservoir extends at least partially around a fuel area provided at a lower end of the fuel reservoir. A wick device is provided in the burning area and an opening (8) to the surroundings is provided at an upper end of the lamp above the burning area. In the in-use position the fuel reservoir is upwardly sealingly closed, whereas it is, at the lower end, in open communication with the burning area, the lamp being configured such that, in operation, a substantially constant liquid level is maintained in the burning area that is exclusively in contact with the surroundings via the opening (8) provided at the upper end of the lamp.
