Abstract (en)

A device for sealing a slit between a bottom sill and a closed door or window, comprising a sealing strip and an operating structure (10-13; 37, 38; 110-113; 220; 320) for moving the sealing strip from a first, retracted position for displacement over the bottom sill to a second, downwardly projecting position for sealingly abutting the sealing strip against the bottom sill and, in reaction to the opening of the door or the window, for moving the sealing strip back from the second position to the first position. In the second position, the sealing strip projects horizontally and in a transverse direction to the sealing strip relative to the connecting area of the operating structure for causing the sealing strip to project at an outer side of the bottom sill beyond an upper side of the bottom sill. The operating structure (10-13; 37, 38; 110-113; 220; 320) has a connecting area for connection to a lower part of a door or window and is coupled to the sealing strip.
