Abstract (en)

[origin: WO0128860A1] The invention relates to a device comprising the following elements arranged above the path along which a honeycomb-structured sheet is displaced: at least one rotating brush (4a) extending transversally across the width of said sheet, whereby said brush is freely and rotatably mounted in a support and connected to means which can drive it rotationally under the control of a control housing. According to the invention, each brush (4a) comprises tubular brush sections (27a-27c) which are mounted on a cylindrical shaft (25), each section being connected to the rotational driving means (25,30) with a torque limiter (28) inserted therebetween, whereby said torque limiter tolerates the pivoting of the section on the shaft beyond an adjustable resistant torque value exerted upon said section and each section is associated with a means (40) limiting the rotation thereof with respect to the shaft (25) that bears it.
