Abstract (en)
[origin: WO0122317A2] A system and method for online vehicle registration uses interactive communication between the user and server to effectively result in a plate/document/article (e.g., license plate, sticker) order for production/distribution. Generally, a communication link is established between a user computer and a registration server. A user interface is presented on the user computer. The user interface provides the user with one or more options associated with the registration of a vehicle. Interactive communication of information associated with the registration of a vehicle between the user computer and the registration server is carried out. For example, user input related to one or more of the options presented to the user by the user interface regarding the registration of a vehicle is communicated by the user to the registration server. Information to the user is provided in response to the user information from the registration server via the user interface. The result of the interactive communication between the user and the registration server is a plate/document/article order associated with the registration of the vehicle. Thereafter, the order is provided to a plate/document/article production facility. The production facility is operable to print a plate/document/article in response to the provision of the order for distribution thereof.
