Abstract (en)

The invention relates to an apparatus for simulating a fire, in particular for use in a fireplace and the like, comprising a housing, in which at least one light source is fitted for lighting at least one first element provided with flame and/or fire simulation patterns, which first element can be moved by means of a driving element, and also comprising a window at the front side of the housing, onto which the created flame and/or fire simulation light patterns can be projected in use. The object of the invention is to provide an apparatus for simulating a fire by means of which a varied, less often recurring and true-to-nature flame and fire image can be created, and according to the invention the apparatus is characterized in that at least one further movable element provided with flame and/or fire simulation patterns is fitted in the housing. <IMAGE>
