Abstract (en)

[origin: WO0125952A1] A service execution method and system for registration of domain names using vernaculars in non-English speaking countries, in which peoples in the non-English speaking countries, which are unable to compete with those in English speaking countries in terms of the security of domain names necessary to the creation of Web sites, can re-create and secure their domain names based on vernaculars, having meanings substantially identical with those previously registered in English. A computer of a user may connect to a vernacular sub-domain Web site directly or through a main domain Web site and select a vernacular domain name registration service to request registration of a domain name based on a vernacular of the user. If the vernacular domain name registration service is selected, a plug-in program is run to automatically produce an arrangement of English characters corresponding to the vernacular-based domain name. Unless the produced English character arrangement has already been registered as an existing domain name, then it is registered as the vernacular-based domain name and the registered result is notified to the user. Therefore, Internet domain names presently in saturation can be re-created as different alternatives thereto by several ten kinds of vernacular keyboards.
