Abstract (en)  
[origin: DE10104065A1] The waste water arrangement (1) has a feed bed (2) and devices preventing sedimentation comprising a dividing wall (3), which with low waste water quantities concentrates them on the feed bed side. Several build-up valves (4) are incorporated, which are connected one behind the other in series along the flow direction. Before the furthest distant upstream channel build-up valve, a sediment retention shaft is arranged.
