Abstract (en)  
[origin: WO0133947A1] The invention relates to an apparatus for a milking machine, comprising a teat cup, a first holding element (16) and a second holding element (17); an apparatus for a milking machine, comprising a liner part (5) and a milk tube part (6) integrated to each other; and a method for adjusting a bending angle of the milk tube part (6) relatively to the teat cup or the liner part (5). The first holding element (16) is mounted to the milk tube part (6) and the second holding element (17) is mounted to a pulse tube (9). The holding elements (16, 17) are detachably connected to each other for adjusting the bending angle. At least one stop element, for example a flange (13), is attached to the milk tube part (6) so as to limit the axial movement of the first holding element (16) on the milk tube part (6).
