Abstract (en)

[origin: EP1229169A2] The element for sealing a gap between a rail (1) and a bordering pavement consists of an elastic compound which is horizontally joined to the rail and at least the first row (5) of paving stones, and is vertically separated from the base structure by means of a separating agent. Also claimed is a method for sealing such gaps. It involves application of a separating agent to the base structure below the gap, and introduction of the sealing compound in plastic state into the gap.
