Abstract (en)  
[origin: WO0126907A1] In order to create a substructure material (100; 100') for a printing mould, in particular a flat printing mould or a printing plate (11), in particular a flat printing plate, and/or a printing cloth (13), in particular a rubber cloth, in a special compressible or non-compressible rubber cloth, and/or for another surface involved in a printing process, in particular in off-set printing wherewith an improved printed image is obtained and which allows printing moulds or print plates to be changed in an easier and more rapid fashion, a substructure material (100; 100') is embodied as an exchangeable, elastically deformable composite material (16, 17, 18; 16', 17') accommodated radially relative to said printing mould or printing plate (11) and/or printing cloth (13) and/or other cylinders (10, 12, 15) involved in the printing process, said cylinders being linked to surfaces or connected radially to a drum.
