Abstract (en)
[origin: WO0138178A1] A packaging blank assembly comprising first and second blanks. The first blank (10) has a body portion (12) and an extension portion (32) separated by fold lines (40). The body portion has two end body panels (14, 22) at respective ends of the body portion and three intermediate body panels (16, 18, 20). The extension portion has four extension panels (36) each of which is joined to a body panel. The two end body panels are adapted to be secured to one another to form a generally tubular container. Each extension panel has a shoulder-forming portion (34) and a neck-forming portion (36) with the shoulder-forming portion being joined to the associated body panel and the neck-forming portion by respective fold lines (40, 38). The second blank (100) has end panels (108, 110) at respective end of the blank and intermediate panels (102, 104, 106), with the ends panels being adapted to be secured to one another to form a tubular closure. When the container blank is folded about its fold lines it forms a representation of a bottle with the body panels forming the body portion of the bottle and the sleeve-forming portions aligning to form a neck of the bottle. The second blank is adapted, when folded, to engage over the neck-forming portions in a sliding manner to retain the container closed.
