Abstract (en)  
[origin: WO0139229A1] The invention relates to a configuration comprising two switching contacts (a, b) connected in series and their two contactors (Sa, Sb). The tripping signals (1, 2) of said two contactors are generated with a variable time-delay ( DELTA t), in such a way that the number of breaking operations (Aai, Abi), which are chronologically initiated first, or closing operations (Eai, Ebi) is practically equal over a prolonged usage period.
