Abstract (en)

[origin: WO0139421A2] The invention relates to a method for adapting the data rate of a data stream in a communication device (1), in particular in a mobile radio transmitter, whereby the individual data blocks are pointed, according to a specific pointing model and the bits pointed according to the pointing model are removed from the respective data block. The pointing model is configured in such a way that it has a steadily increasing pointing rate extending from the middle of the discrete data block to at least one end of said data block.
