Abstract (en)

[origin: WO0135595A1] A technique for transferring content between a server and a client when the client has a limited CPU capability includes the client forwarding a request for content to the server with a header, the header including the characteristics of the client. The server then scales the requested content according to the client characteristics contained in the header so as to be suitable for use by the client prior to transmitting the content to the client. In addition, the technique for transferring content between a server and a client having a limited memory capacity via a gateway disposed between the server and client includes splitting a page to be sent to the client from the server into two or more sub-pages when the memory of the client is insufficient to store the entire page, the information as to the size of the memory of the client being forwarded to the gateway.
