Abstract (en)
[origin: DE10106728A1] Portable arrangement for determination of golf green geometry has an emitter for transmission of signals and a receiver for capture of the back scattered signals. The emitter transmits signals over a range or directions, while the receiver receives signals back from a range of directions. An analysis device determines slope geometry from time of flight differences in the received signals. The invention also relates to a method in which the device is used to determine the slope between a ball and hole on a golf green over a planned shot path. The signal can be radar or ultrasound based.
