Abstract (en)
The invention relates to the game and leisure industry, in particular to methods and devices for conducting iteration-and-analytical games which are based on the principle of sequential placing of wagers on information elements taken from the preset game set, with analysis of the quantitative distribution of said wagers. The game method involving wagers is characterized in that the drawing of wagers in a new round of the game is started at registration of the first signal with information about a wager, upon completion of a previous round or upon announcement of the game start, in which, at every iteration of the wager drawing, signals carrying information about the wager quantitative distribution on elements taken from the game set are communicated through communication channels to data display means of a player whose information is treated at this iteration. The invention provides a maximum level of interactivity and/or informative transparency of the game process, thereby improving the level of game interest as well as intellectual and sporting rivalry of iteration-and-analytical games for the players and spectators. <IMAGE>
