Abstract (en)

[origin: EP1234939A2] The assembly to lock, hold and press a door or window at its frame has at least two rigidly interconnected lever arms (10,11), which rotate at the door (1) to project freely. They work together with matching catches (12) at the door frame (3). At least one lever arm is near the door lock (5). When the door is closed, the shrouding flaps (6,7) are moved into place over the lock zones, to cover any gap between the door and the frame.
