Abstract (en)

[origin: WO0143112A1] The invention relates to a combination of the technique of underscanning two lines of display cells together and the division of the underscanning procedures into two groups. The combination of these two aspects makes it possible to pool the benefits of two apparently incompatible techniques. The invention provides for a static and/or dynamic compensation of the first underscanning procedures of each individual cell with second underscanning procedures of two cells together, respectively.
