Abstract (en)

[origin: WO0140265A2] Ligands that interact with a target, such as one present on a virus, can be more easily identified if false positive interactions (either specific or non-specific) are differentiated from the target-specific interaction. An improved method for screening a library of surface-immobilized ligands which bind to a target is presented. The method can be used for multiple screenings of the same surface-immobilized library for a number of different ligands.
