Abstract (en)

[origin: WO0140641A1] The invention concerns the modification of compression rate by using technological components similar to conventional components of engines. The turbines (26) and (81) mounted to operate in opposite direction drive a screw (32) and displace the pivot (29) which articulates the rod (35) integral with an eccentric (8a) located between the rod small end (6a) and the crankpin (5). The invention is particularly designed to increase power performance and reduce polluting waste in engines.
