Abstract (en)

[origin: EP1919147A1] A waveform adaptive transmitter that conditions and/or modulates the phase, frequency, bandwidth, amplitude and/or attenuation of ultra-wideband (UWB) pulses. The transmitter band-limits UWB signals within spectral limits for use in communication, positioning, and/or radar applications. One embodiment comprises a low-level UWB source (e.g. and impulse generator (100) or time-gated oscillator (106)), a waveform adapter (e.g. digital or analog filter (102), pulse shaper, and/or voltage variable attenuator (112)), a power amplifier, and an antenna to radiate a band-limited and/or modulated UWB signals. In a special case where the oscillator has zero frequency and outputs a DC bias, a low-level impulse generator impulse-excites a bandpass filter to produce an UWB signal having an adjustable center frequency and desired bandwidth based on a characteristic of the filter. The UWB transmitter is capable of extremely high pulse repetition frequencies and data rates in the hundreds of megabits per second or more, frequency agility on a pulse-to-pulse basis allowing frequency hopping if desired, and extensibility from below HF to millimeter wave frequencies.
