Abstract (en)

[origin: WO0145433A2] A method for switching connections is disclosed, inter alia, whereby connections between terminals are switched, in an exchange device (14). Connection data (50, 52), for a connection with more than one terminal, is stored on switching. The connection data of at least one connection is accessed for the determination of a terminal connected to a connection and/or for the determination of the engaged state of the terminal. The type of terminal and the engaged state thereof are determined in a manner different to the conventional manner. The method is particularly applicable for the "callback" function.
