Abstract (en)  
[origin: DE10111134C1] The edge zone (14) of the sheet to be folded is clamped between the upper and lower dies and a shaping edge bends the plate along the folding line. The shaping edge swings on a rotating body (4) in a housing (5), so that the straight closing movement of the press is converted into a swing movement at the folding edge. The movement of the lower die is also converted into a swing motion, to swing the shaping edge.
