Abstract (en)

[origin: EP1238923A2] The container for holding and delivering a free flowing sealing medium has a compressed gas operated piston (18) for compressing the sealing medium held inside the volume (14) of the container. On the end lying opposite the piston the volume has an outlet opening (20) sealed by a first plate (22) which opens by pressure action. The piston has a passage (26) closed off by a second plate (24) which opens following a pressure increase in the piston's pressure chamber and open a path from the compressed gas source through the volume to the outlet opening. The opening of the second plate takes place after the opening of the first.
