Abstract (en)

[origin: EP1239221A2] The fuel supply appliance has at least one chamber (20,22) into which leads a fuel-pipe (24) with an admission pressure section (26), and from which leads a pipe (28A,B) with an ultimate pressure section (28). Between the admission and ultimate pressure sections is a dispenser (10) possessing a movable piston (18) movably mounted in a cylinder (12,14). The two chambers with changeable volume are on opposite ends of the piston. The dispenser directly raises the fuel's ultimate pressure to that required by the burner.
