Abstract (en)

[origin: EP1339002A1] In a computer system (999), peripheral computers (901/902) with business applications (201/202) send alert messages (211/212) to a central computer (900) when a current variable exceeds a reference value. The central computer implements an alert server to notify (301) a target group of multiple users (1, 2, 3) via communication devices (903, 904, 905). The group of users (1, 2, 3) to be notified is determined by subscription or by a role-to-application assignment. <IMAGE>
