Abstract (en)  
[origin: WO0141843A1] A disposable, single use syringe comprised of a hollow body, a retractable needle assembly positioned in the hollow body, and a plunger assembly in the hollow body. The plunger assembly includes an elongated frame portion including at least one guide track between its ends. A retraction member is releasably secured to one end of the frame and a catch member, including a catch tip, is positioned with a guide configured to travel in the plunger frame guide track. An elastomeric member extends between the retraction member and the catch member. A retention assembly depends from the opposite end of the plunger frame and is configured to receive and secure the catch tip and thereby tension the elastomeric member. The needle assembly and the retraction member have complimentary mating members, whereby the tension on the elastomeric member is released when the needle assembly and the retraction member mate and the injection means is drawn into the hollow body. A method of manufacture is also provided.
