Abstract (en)

[origin: WO0145811A1] The invention relates to a board-like gliding device (1), in particular a ski (2) or a snowboard, consisting of several layers disposed between a running surface coating (25) and a covering layer (24), comprising an upper belt (31) disposed adjacent to a covering layer (24) and/or a lower belt (32) that is made of highly resistant material and is disposed adjacent to a running surface coating (25). Said layers and a core disposed between the layers form at least one composite element. At least one molded profile (12, 13) is assigned to the core or said core is formed by at least one molded profile (12, 13). At least one partial area of the enveloping surface of the molded profile (12, 13) is embedded or mounted in a layer (44, 45) made of an elastic plastic material, preferably in a layer (44, 45) made of foamed plastic material, which is flexible when force is exerted via the molded profile (12, 13) and elastically returns to its original shape.
