Abstract (en)

[origin: WO0146033A1] The invention relates to a plastic closure comprising an upper closure part (1) and a lower closure part (2), which when in use form two separate parts (1, 2). Both of said closure parts (1, 2) are connected as a single component to each other via a hinge (7) or joint hinge (7), thereby allowing rotation of the closure parts (1, 2) about 180 DEG . In said non-closed position, the closure is quickly injected as a one component part. The hinge (7) or joint hinge (7) is connected via predetermined breaking points to one or both closure parts (1, 2). The hinge or joint hinge can be detached from the said closure part(s) by hand and therefore serves as a tamper-proof seal.
