Abstract (en)

[origin: EP1240928A1] The retainer for the hurdle bar for horse jumping sport holds the bar for which it incorporates a horizontal holding device (13-16), releasing it to a horizontal side under the effect of a minimum horizontal force. A vertical holding device (20-24) retains the bar in a vertical direction and can release it downwards under the effect of a minimum acting force. The horizontal holding device incorporates a spring (15), the force of which has to be overcome by the horizontal minimum force. The spring is adjustable. The horizontal holding device includes a round form component (16) activated by the spring and for engagement in a recess (18).
